

Growth hardware, not gravity, sets the atmosphere at the leaf

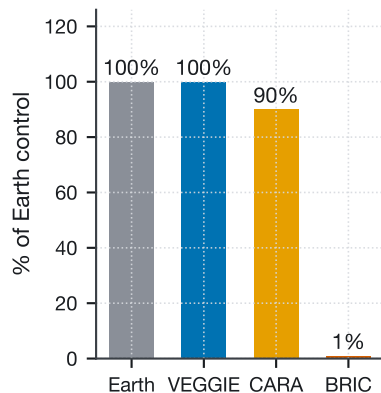

a The conductance chain

b Leaf-surface CO_2 , microgravity

c Carbon gained over 12 h

d How fast a sealed canister changes

BRIC lit: CO_2 400 $\rightarrow$ ~0 ppm
7 minutes

BRIC dark: $CO_2 \rightarrow 1\%$
9.4 hours

BRIC dark: O_2 21% $\rightarrow$ 5%
6.5 days

CARA / VEGGIE: vents to cabin
bounded

The 7-minute drawdown is a mass balance, so it happens in the ground control too — which is why it cancels out of flight-vs-ground.
